

Single-Area OSPF Implementation

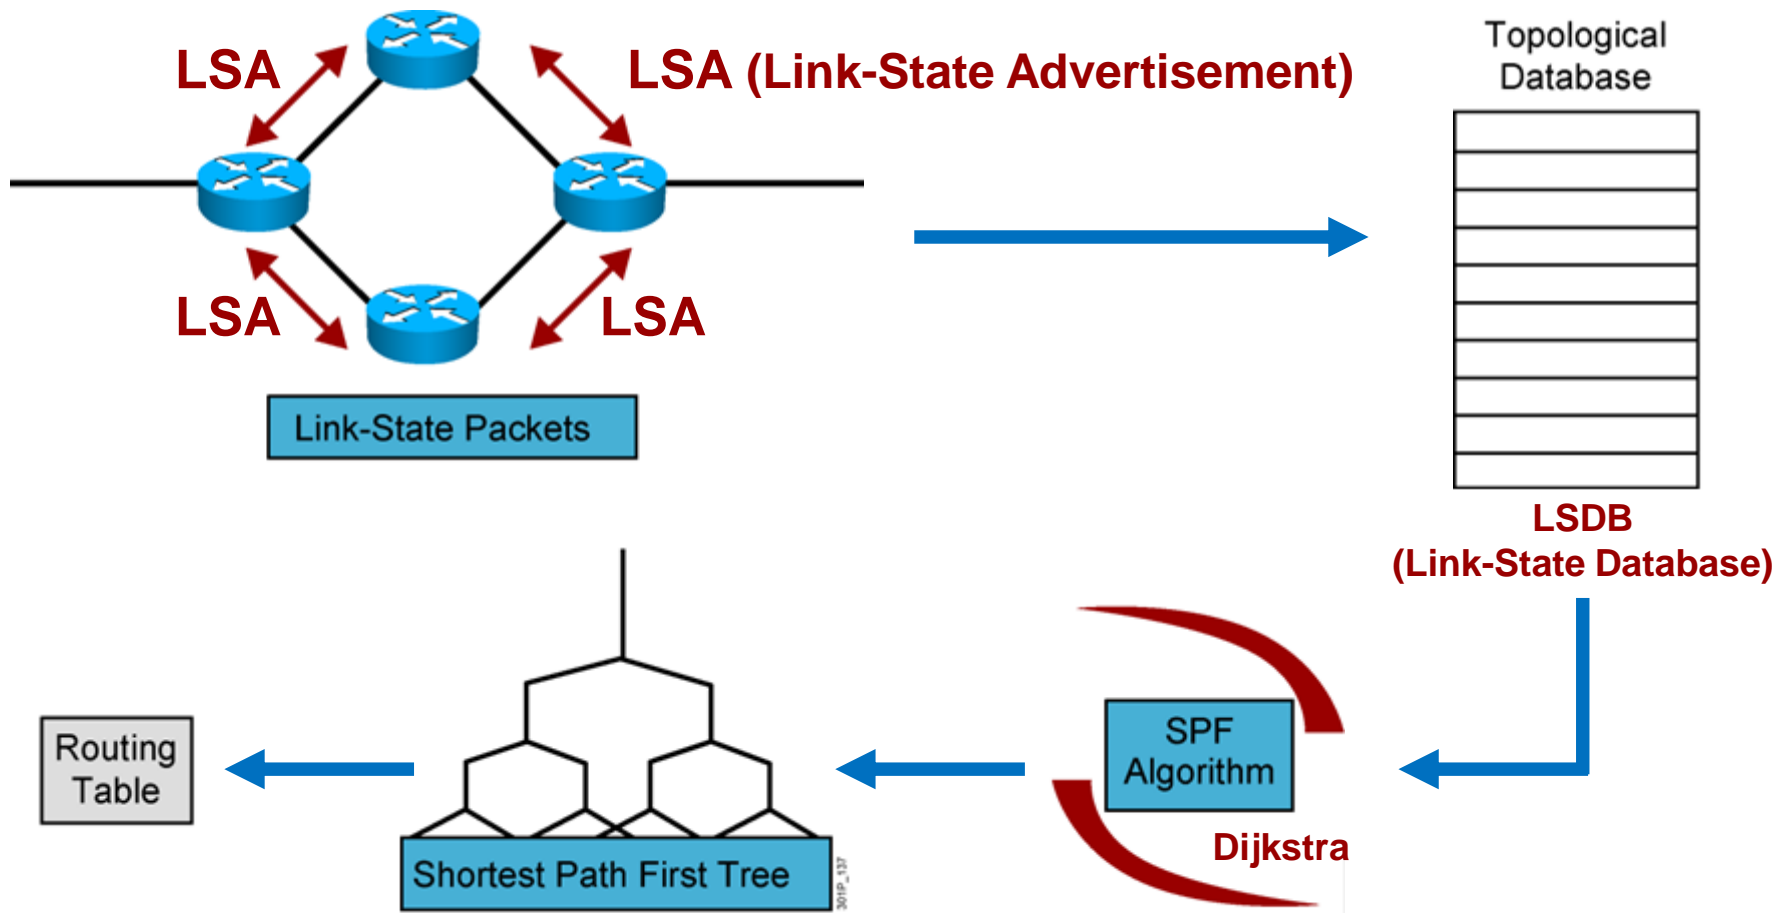

Implementing OSPF (Open Shortest Path First)

Distance Vector Routing Protocols

Passes periodic copies of routing table to neighbor routes and accumulates distance vectors

Link-State Routing Protocols

Link-State Routing Protocol Algorithms

Benefits and Drawbacks of Link-State Routing

- **Benefits of link-state routing:**
 - Fast convergence:
 - Changes are reported immediately by the affected source
 - Robustness against routing loops:
 - Routers know the topology
 - Link-state packets are sequenced and acknowledged
 - Hierarchical network design enables optimization of resources.
- **Drawbacks of link-state routing:**
 - Significant demands for resources:
 - Memory (three tables: adjacency, topology, forwarding)
 - CPU (Dijkstra's algorithm can be intensive, especially when there are many instabilities)
 - Requires very strict network design
 - Configuration can be complex when tuning various parameters and when design is complex

OSPF Overview

- AD = 110
- Creates a neighbor relationship by exchanging hello packets
- Propagates LSAs rather than routing table updates
 - Link: Router interface
 - State: Description of an interface and its relationship to neighboring routers
- Floods LSAs to all OSPF routers in the area, not just directly connected routers
- Pieces together all the LSAs generated by the OSPF routers to create the OSPF link-state database
- Uses the SPF algorithm to calculate the shortest path to each destination and places it in the routing table

OSPF Hierarchy Example

Configuring Loopback Interfaces

Router ID:

- Number by which the router is known to OSPF (32 bits)
- Default: The highest IP address on an active interface at the moment of OSPF process startup
- Can be overridden by a loopback interface: Highest IP address of any active loopback interface
- Can be set manually using the **router-id ...** command

Unadvertised Loopback Address

Ex.: 192.168.255.254

- Used for OSPF router ID
- Saves address space
- Cannot be used to remotely administer router

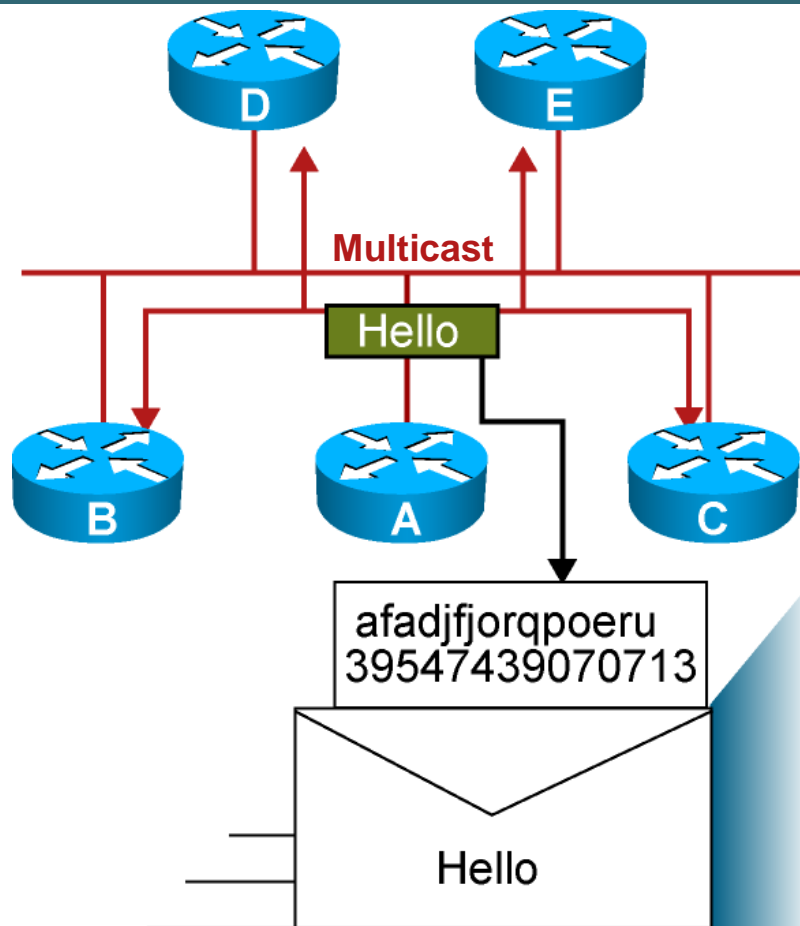

Advertised Loopback Address

Ex.: 172.16.17.5

- Used for OSPF router ID
- Uses address space
- Can be used to remotely administer router

Neighbor Adjacencies: The Hello Packet

Default Hello interval: 10 seconds
Default Dead interval: 40 seconds

Router ID
Hello and dead intervals *
Neighbors
Area ID *
Router priority
DR IP address
BDR IP address
Authentication password *
Stub area flag *

327P_117

* Entry must match on neighboring routers → 2-WAY state

Point-to-Point Links

- Usually a serial interface running either PPP or HDLC.
- May also be a point-to-point subinterface running Frame Relay or ATM.
- No DR or BDR election required.
- OSPF autodetects this interface type.
- OSPF packets are sent using multicast 224.0.0.5.

Multiaccess Broadcast Network

- Generally these are, LAN technologies like Ethernet and Token Ring.
- DR (Designated Router) and BDR (Backup Designated Router) selection are required.
- Packets to the DR and the BDR use 224.0.0.6.
- Packets from DR to all other routers use 224.0.0.5.
- All neighbor routers form full adjacencies with the DR and BDR only.

Electing the DR and BDR

- Hello packets are exchanged via IP multicast.
- The router with the **highest OSPF priority** is selected as the **DR**. The router with the **second-highest priority** value is the **BDR**.
- OSPF Priority: 0 → 255 (default = 1)
- Use the OSPF router ID as the tiebreaker.
- The DR election is nonpreemptive.

Setting Priority for DR Election

```
Router(config-if) # ip ospf priority number
```

- This interface configuration command assigns the OSPF priority to an interface.
- Different interfaces on a router may be assigned different values.
- The default priority is 1. The range is from 0 to 255.
- 0 means the router cannot be the DR or BDR.
- A router that is not the DR or BDR is DROTHER.

SPF Algorithm

- Places each router at the root of a tree and calculates the shortest path to each destination based on the cumulative cost

OSPF Cost

$$\text{Cost} = \frac{\text{Reference Bandwidth}}{\text{Interface Bandwidth}}$$

- Reference Bandwidth (default) = 100 Mbps = 100.000.000 bps = 10^8
 - Ethernet → Interface Bandwidth = 10 Mbps = 10.000.000 bps = 10^7
$$\text{Cost} = \frac{10^8}{10^7} = 10$$
 - Fast Ethernet → Interface Bandwidth = 100 Mbps = 100.000.000 bps = 10^8
$$\text{Cost} = \frac{10^8}{10^8} = 1$$
- 

```
RouterX(config-router)# ospf auto-cost reference-bandwidth ref-bw
```

- Change OSPF reference bandwidth (if needed)

```
RouterX(config-if)# ip ospf cost cost_value
```

- Change OSPF cost for an interface (if needed)

Configuring Single-Area OSPF

```
RouterX(config)# router ospf process-id
```

- Defines OSPF as the IP routing protocol

local

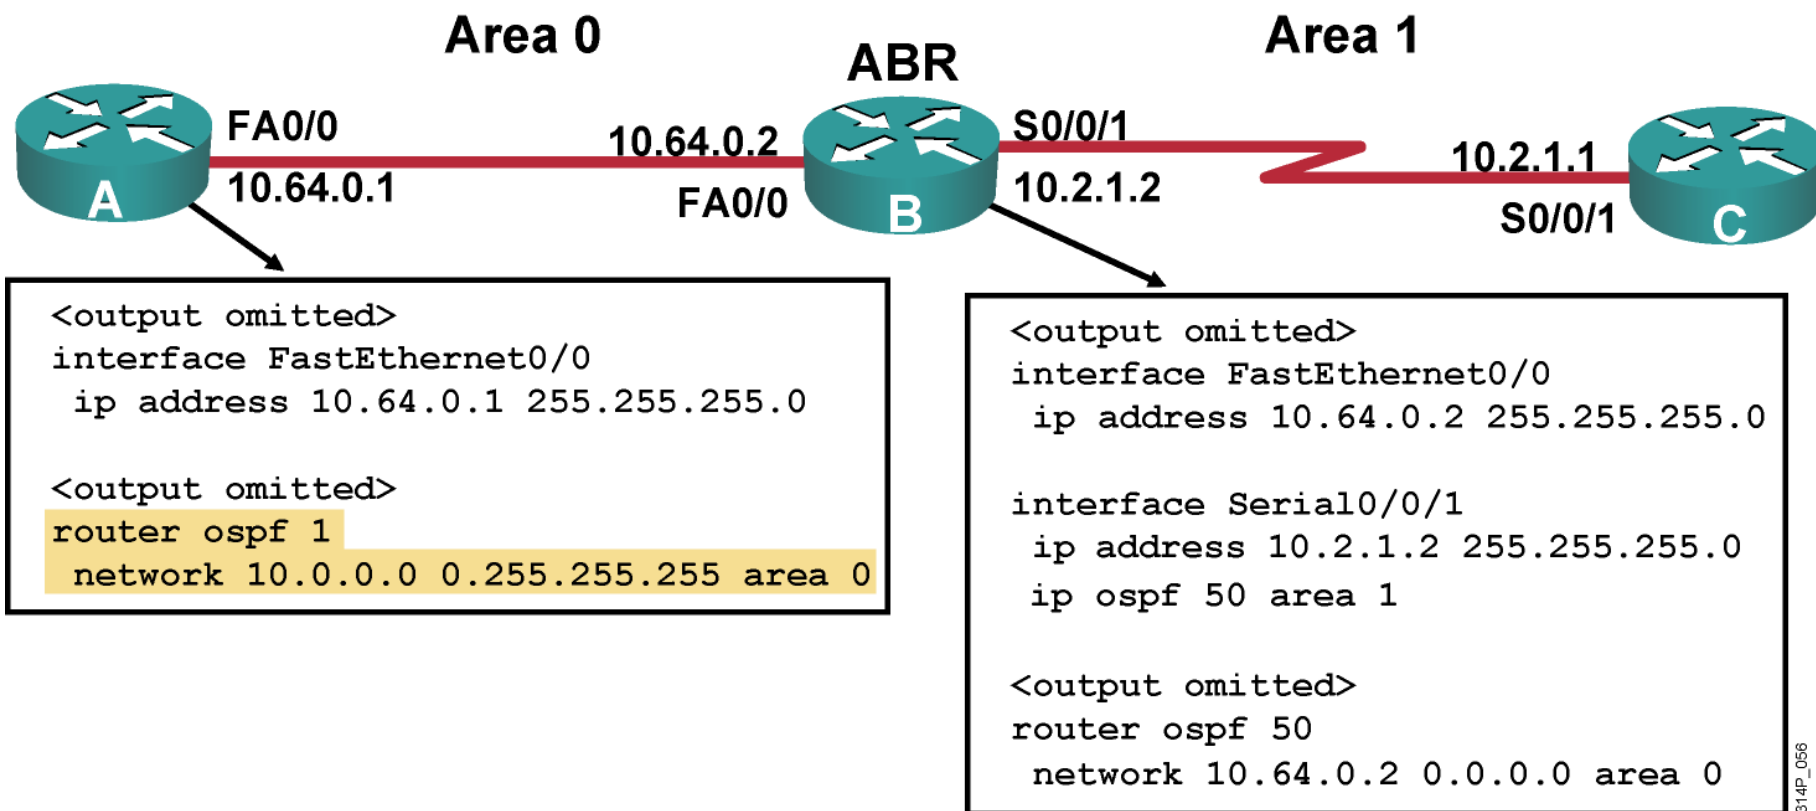

```
RouterX(config-router)# network address wildcard-mask area area-id
```

- Assigns networks to a specific OSPF area

```
router ospf 100
network 10.1.1.2 0.0.0.0 area 0
network 10.2.2.2 0.0.0.0 area 0
```

Configuring OSPF for Multiple Areas

Load Balancing with OSPF

OSPF load balancing:

- Paths must be equal cost
- By default, up to four equal-cost paths can be placed into the routing table
- With a configuration change, up to a maximum of 16 paths can be configured:
 - `(config-router)# maximum-paths <value>`
- To ensure paths are equal cost for load balancing, you can change the cost of a particular link:
 - `(config-if)# ip ospf cost <value>`

Load Balancing with OSPF

Using passive-interface command

- No need to talk to host by OSPF
- Disables OSPF on selected interfaces.
- Still advertise subnet on the selected interfaces.

Verifying the OSPF Configuration

```
RouterX# show ip protocols
```

- Verifies that OSPF is configured

```
RouterX# show ip route
```

- Displays all the routes learned by the router

```
RouterX# show ip route
```

```
Codes: I - IGRP derived, R - RIP derived, O - OSPF derived,  
C - connected, S - static, E - EGP derived, B - BGP derived,  
E2 - OSPF external type 2 route, N1 - OSPF NSSA external type 1 route,  
N2 - OSPF NSSA external type 2 route
```

```
Gateway of last resort is 10.119.254.240 to network 10.140.0.0
```

```
O 10.110.0.0 [110/5] via 10.119.254.6, 0:01:00, Ethernet2  
O IA 10.67.10.0 [110/10] via 10.119.254.244, 0:02:22, Ethernet2  
O 10.68.132.0 [110/5] via 10.119.254.6, 0:00:59, Ethernet2  
O 10.130.0.0 [110/5] via 10.119.254.6, 0:00:59, Ethernet2  
O E2 10.128.0.0 [170/10] via 10.119.254.244, 0:02:22, Ethernet2  
. . .
```

Verifying the OSPF Configuration (Cont.)

```
RouterX# show ip ospf
```

- Displays the OSPF router ID, timers, and statistics

```
RouterX# show ip ospf
```

```
Routing Process "ospf 50" with ID 10.64.0.2  
<output omitted>
```

```
Number of areas in this router is 1. 1 normal 0 stub 0 nssa
```

```
Number of areas transit capable is 0
```

```
External flood list length 0
```

```
Area BACKBONE(0)
```

```
Area BACKBONE(0)
```

```
Area has no authentication
```

```
SPF algorithm last executed 00:01:25.028 ago
```

```
SPF algorithm executed 7 times
```

```
<output omitted>
```

Verifying the OSPF Configuration (Cont.)

```
RouterX# show ip ospf interface
```

- Displays the area ID and adjacency information

```
RouterX# show ip ospf interface ethernet 0
```

```
Ethernet 0 is up, line protocol is up
Internet Address 192.168.254.202, Mask 255.255.255.0, Area 0.0.0.0
AS 201, Router ID 192.168.99.1, Network Type BROADCAST, Cost: 10
Transmit Delay is 1 sec, State OTHER, Priority 1
Designated Router id 192.168.254.10, Interface address 192.168.254.10
Backup Designated router id 192.168.254.28, Interface addr 192.168.254.28
Timer intervals configured, Hello 10, Dead 60, Wait 40, Retransmit 5
Hello due in 0:00:05

  Adjacent with neighbor 192.168.254.28 (Backup Designated Router)
  Adjacent with neighbor 192.168.254.10 (Designated Router)
```

Verifying the OSPF Configuration (Cont.)

```
RouterX# show ip ospf neighbor
```

- Displays the OSPF neighbor information on a per-interface basis

```
RouterX# show ip ospf neighbor
```

ID	Pri	State	Dead Time	Address	Interface
10.199.199.137	1	FULL/DR	0:00:31	192.168.80.37	FastEthernet0/0
172.16.48.1	1	FULL/DROTHER	0:00:33	172.16.48.1	FastEthernet0/1
172.16.48.200	1	FULL/DROTHER	0:00:33	172.16.48.200	FastEthernet0/1

neighbor's state

Verifying the OSPF Configuration (Cont.)

```
RouterX# show ip ospf neighbor 10.199.199.137
```

```
Neighbor 10.199.199.137, interface address 192.168.80.37  
In the area 0.0.0.0 via interface Ethernet0  
Neighbor priority is 1, State is FULL
```

```
Options 2
```

```
Dead timer due in 0:00:32
```

```
Link State retransmission due in 0:00:04
```

```
Neighbor 10.199.199.137, interface address 172.16.48.189  
In the area 0.0.0.0 via interface Fddi0  
Neighbor priority is 5, State is FULL
```

```
Options 2
```

```
Dead timer due in 0:00:32
```

```
Link State retransmission due in 0:00:03
```

OSPF debug Commands

```
RouterX# debug ip ospf events
```

```
OSPF:hello with invalid timers on interface Ethernet0  
hello interval received 10 configured 10  
net mask received 255.255.255.0 configured 255.255.255.0  
dead interval received 40 configured 30
```

```
